

Technical Data

Pole Anchor: 76x800mm, galvanized steel, 4 adjustment screws

In many cases it is not sufficient to simply pound a pole into the ground. Especially soft soils don't offer enough support to the weight of a weather station. In these cases this soil anchor is a solid alternative. It can simply be screwed into the soil, and, by compacting the soil around it, will provide a sturdy support to your weather station or RTU mast.

The four adjustment screws that are provided allow proper vertical adjustment of the pole, which is of particular importance if you have a pyranometer and/or a rain gauge mounted to the pole.

The anchor is made of galvanized steel and will last a lifetime!

Weight	3,1kg
Diameter	76mm
Length	800mm
